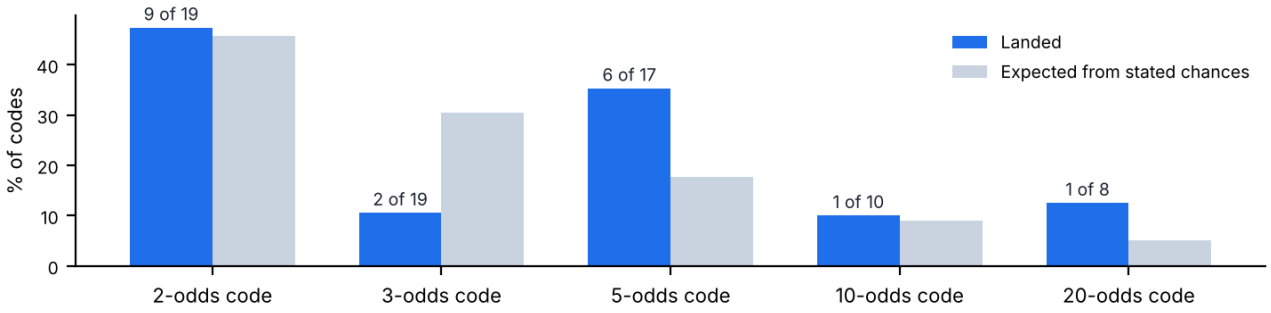
Forge and Code Hub codes: audit

Prepared 4 November 2026. Nothing in this report changes what ships; it says what is solid, what is not, and what to do.

Bottom line. The numbers behind both products hold up. Code Hub codes land about as often as they say, live and in a year of replays, and since 28 Oct they load at the odds they are named for. Forge slips also land about as often as they say, but only because a SportyBet check removes the model's over-confident legs; without it they land 1 to 8 points under. The real issues are different: **Forge has no live record at all**, the check does not cover games SportyBet does not list, and **a code's expected return is negative by design** because the bookmaker's margin compounds with every leg.

1. Code Hub, live (16 Oct to 4 Nov, 74 codes)



Code	Codes	Won	Expected	Avg odds	Avg legs
2 odds	19	9	8.7	1.91	3.3
3 odds	19	2	5.8	2.84	4.6
5 odds	17	6	3.0	4.60	5.6
10 odds	10	1	0.9	9.11	5.7
20 odds	8	1	0.4	16.33	8.0

All tiers: 19 codes won against 19.8 expected; at least one code landed on 13 of 19 days (replay: 67%). Of 384 legs, 74.6% landed against 72.1% stated. The 3-odds code's 2 of 19 is about a 1-in-13 chance if the model is right, with nothing wrong at leg level: variance. Every code since 23 Oct has a booking code.

2. Code Hub, a year of replays

Code	Built on	Landed	Expected	Loads at
2 odds	218 days	43.6%	38.1%	2.01
3 odds	197	32.5%	24.8%	3.01
5 odds	159	9.4%	14.7%	4.97
10 odds	117	16.2%	7.6%	9.74
20 odds	74	1.4%	3.1%	19.39

Legs land about at their stated chance at every tier; the code-level swings come from codes on one day sharing games. Raising the minimum leg chance from 60% to 65% or 70% changed only noise, and 70% stops the 10 and 20 codes being built on most days, so it stays at 60%.

3. What a code is expected to pay

Each leg's SportyBet price is about 5.5% under the model's fair price, and that compounds over 3 to 8 legs.

Code	Return per 1 staked at the model's stated chances	If legs keep landing 3% above stated (as they have)
2 odds	0.88	0.97
3 odds	0.86	1.00
5 odds	0.81	0.97
10 odds	0.84	1.01
20 odds	0.72	0.93

On the model's own numbers every code loses money in expectation, more so the longer it is. It is close to break-even only if the model's small under-confidence is real and persists. The live result (-2.4 units on 75 codes) is inside the noise of either case. If the product says anything about profit from codes, it should say this.

4. Forge, replayed

Forge slips are not stored, so the only evidence is a replay: every match day of the last year, Forge's real builder, SportyBet's closing price standing in for its board, graded on the scores. Two picks per game, four default markets:

Style	Slips	Landed (with the market check)	Stated	Landed with no check
Safe 2.5, 3 games	217	44.2%	40.9%	41.9% (stated 42.0%)
Balanced 5, 4 games	206	23.8%	20.9%	19.4% (stated 22.8%)
Balanced 10, 5 games	195	12.3%	10.5%	10.8% (stated 12.8%)
Risky 20, 5 games	195	3.1%	5.3%	4.6% (stated 6.8%)

One pick a game gives the same picture (40.1 / 16.0 / 7.7 / 4.6% landed against 39.0 / 20.3 / 10.4 / 5.2% stated). The check is the SportyBet comparison in production: a leg the market rates 5 points or more below the model is dropped. It matters because Forge's solver picks the legs with the most chance for their price, which is exactly where the model most disagrees with the market, and the market is usually right. Two solver changes (maximise the slip's overall chance; rank legs by the lower of the model's and the market's chance) were tested on top of the check and made no difference beyond noise.

5. Findings and what to do

Not audited: the Code Hub editor's chances on raw SportyBet markets (goal bounds, half markets, 1UP), which the code describes as estimates and which have no live record. Detail and reproduction: docs/model-audit-teams-2026-11.md, section I.

#	Finding	Size	What to do
1	**Forge has no live record.** Slips are not stored, so nothing can be checked after the fact.	Medium	Log each built slip (legs, stated chance, price) and grade it nightly. A week gives a record.
2	**The market check only covers games SportyBet lists.** Off the board, a game's legs go through unchecked, and unchecked legs are the ones that land under their stated chance.	Medium	Measure how many pool games are unlisted. Either apply a stricter leg floor there or flag the slip.
3	**Forge counts an unpriced leg at fair odds** (no margin), and shows same-game combos at fair odds. The hub fixed this after a 10 loaded at 6.22; Forge did not. A slip can show a total above what SportyBet pays.	Medium	Deduct the same 7% margin the hub uses on unpriced legs, and label combo odds as estimates.
4	**Community ranking rewards model-versus-market gaps.** It ranks by our chance times SportyBet's odds, so codes where we most exceed the market rank first, which is where we are most often wrong. (Not tested.)	Medium	Rank on the lower of the two chances, as the hub does.
5	**Codes cost money in expectation** (section 3).	Product	Check any copy that implies profit.
6	7 of 15 settled community posts never get a result (markets we cannot grade, 18 games, odds above 100,000). Also: the 20-odds code is built on about 40% of days, the 10 on half.	Low	Cap legs or odds on a post. Tell members the long codes are not daily.
